

Agentic Auth

Tuesday, May 12, 2026 16:26

The four components of auth for agents

1. Identity

Who is the agent, who does it represent, and who vouches for it?

2. Scoping

What is the agent allowed to do, and how is it constrained?

3. Approvals

Who approves what the agent is about to do, and how?

4. Enforcement

How do we ensure the agent does only what was approved, in real time?

Who vouches for agents?

Hint: It's the same as who vouches for humans

Services

In-house authentication

Identity Providers

SAML SSO

Trusted Third Parties

"Sign in with Google"

 Stripe Projects

How should agents be secured?

How should agents be scoped?

By Role

By Permissions

By Task

How are tasks specified?

Where do approvals happen?

Hint: The same places that vouch for identity can also vouch for approvals.

Agent Enforcement

How do we ensure the agent does only what was approved, in real time?

Services will want an enforcement engine

1. Approval

When a request reaches a service, it knows that a task has been scoped and approved.

2. Enforcement

How does the service enforce that the LLM only executes what was approved?

How does enforcement happen?

The service needs to know an agent's task, so it can audit its session in real-time.
